Cluster and Factor Analysis of Satisfaction Perception of B-learning of Medical Terminology

Miervaldis KARULIS Language Center, Rīga Stradiņš University, 16 Dzirciema Street, Riga, LV 1007, Latvia

ABSTRACT

This study was dedicated to exploration of student perception of satisfaction of b-learning. The aim was to evaluate student satisfaction attributes (objective and subjective) in the blearning setting of the study courses: Medical Terminology in Latin and English and to reveal homogenous groups of students of different study programmes Dentistry, Medicine, Nursing, Occupational Therapy, Physiotherapy and Public Health with respect to their satisfaction of b-learning at Rīga Stradiņš University. A cross-sectional study was carried out involving 418 students in the years of 2018 and 2019. The survey comprised 6 domains: information quality, system quality, service quality, use, user satisfaction and net benefits. Satisfaction attributes (10) were evaluated according to students' objective (fulfillment) and subjective (perception) aspects. For each attribute an index was created, which was used to reveal homogeneity of student groups. A two-step cluster analysis, factor analysis and non-parametric tests were performed using IBM SPSS Statistics 20. The results indicated a high rate of satisfaction of e-learning (46% - 67%), while the cluster analysis segregated 3 groups of students of different study programmes with respect to their responses. The exploratory factor analysis revealed 4 factors. The obtained results can be taken into account when creating personalized blearning courses and conducting further surveys.

Keywords: B-learning, Satisfaction, Perception, Cluster analysis, Factor analysis, Medical Terminology.

1. INTRODUCTION

Learning Management Systems (LMS) have been extensively used in higher education institutions for the last two decades. LMS involve learning platforms that effectively use Information and Communication Technology, among which MOODLE is one of the most popular. These learning platforms are an integral part of distance learning. Besides they have been successfully incorporated in blended learning (b-learning) or partially online courses providing a choice of learning style. Online education or e-learning has led to significant changes in how students learn and how they are taught. Mahande and Jasruddin [1] define E-learning as a dynamic learning environment through the use of the Internet to improve the quality of learning.

Higher education policy makers worldwide are focusing on integrating e-learning systems into all study programs, while fully respecting student's interests and satisfaction. The teaching staff of Language Center of Rīga Stradiņš University have been implementing b-learning in several courses of Medical Terminology in the e-learning environment (MOODLE) for the last three years, hence, an increased interest in achieving higher levels of student satisfaction with b-learning.

The aim of the present study was to evaluate the student satisfaction and perception (objective and subjective) in the blearning setting of the study courses: Medical Terminology in Latin and English and to reveal homogenous groups of students of different study programmes and courses. The findings of the study should be taken into consideration when improving blearning courses for particular groups of students.

2. E-LEARNING SATISFACTION MODELS

In 1989, Davis [2] propounded the Technology Acceptance Model (TAM), which is based on 4 factors: perceived usefulness, ease of use, attitudes, and intention regarding user acceptance of technology. TAM has been widely accepted among researchers. Much research has been conducted on student satisfaction with e-learning in attempt to find its influencing factors. Satisfaction becomes key for its success. The Latin word "satis" means sufficiently, well enough and adequately. According to Sary and Herlambang [3] "satisfaction is a pleasant or unpleasant emotional state that is displayed in a positive attitude toward various activities and responses to the external environment", or Zaheer, Babar, Gondal and Qadri [4] define satisfaction "as a person's attitude or feelings associated with various factors that are affecting a particular situation". In the educational setting, Avgerinou [5] points out that satisfaction is "the perceived value of the learner with educational experiences", but the authors in [4] consider students' satisfaction as "perception developed from the perceived value of education and experience gained". As a result, satisfaction can lead to students' higher motivation, engagement, and success. TAM and its modifications have been extensively used in measuring satisfaction of e-learning, for instance, Zaili, Moi, Yusof, Hanfi and Suhaimi [6] examine the influencing factors, Sunkara and Kurra [7] focus on the personalization factors of e-learning and Roach and Lemasters [8] deal with the level of satisfaction with e-learning in comparison to traditional one. For e-learning satisfaction research, the authors of [9, 10] describe the application of the Kano Model, which involves two aspects of the attribute: an objective (fulfillment) and subjective (perception of satisfaction). To identify critical elements of b-learning the researchers of [9] use five attributes: system quality, service quality, information quality, use and net benefit, which were previously included in the Kano model quality attributes.

3. MATERIALS AND METHODS

To evaluate student satisfaction and perception of e-learning, a cross-sectional study was carried out in December, 2018, and

4. RESULTS

Most of the students (>50%) (Table 2) were satisfied with the availability of interactive e-study environment at any time and place, its technical stability and reliability as well as the availability of instructions how to perform e-assignments.

The response "I consider important" received the highest frequency for the attribute of easy to use and user-friendy interface of the e-study environment, but the least for availability of interactive e-study environment at any time and place. The students' perception of availability of audio/video resources and use of mandatory (graded) exercises and tests in the e-study environment received "I can accept". The response "I do not care" was given more frequently to availability of audio/video resources in the e-study environment and a variety of communication options (on-site: in pairs, groups - and on-line: Internet). Stydents were more dissatisfied with availability of audio/video resources in the e-study environment, but least satisfied with availability of instructions how to perform e-tests with examples in the e-study environment and instructions how to perform e-tests with examples in the e-study environment.

Table 2. Distribution of students' responses by percentage

	I am dissatisfied; %	I do not care; %	I can accept; %	I consider important; %	I am satisfied; %
Q1 Technical stability and reliability in the e- study environment	2.4	1.4	3.1	32.1	61.0
Q2 Easy to use and user- friendly interface of the e-study environment	1.7	2.4	9.6	37.1	49.2
Q3 Lecturer's instructions how to use the e-study environment	1.0	9.3	7.7	32.5	49.5
Q4 Availability of audio/video resources in the e-study environment	5.0	15.3	12.5	30.1	37.1
Q5 A variety of communication options (on-site: in pairs, groups - and on-line: Internet)	1.7	13.6	11.2	27.3	46.2
Q6 Possibilities of knowledge self- assessment in the e-study environment	2.4	6.0	7.6	33.5	50.5
Q7 Use of mandatory (graded) exercises and tests in the e-study environment	2.6	6.0	11.2	30.4	49.8
Q8 Blended learning (combination of traditional learning with an interactive e-study environment)	0.7	8.6	8.4	30.4	51.9
Q9 Availability of instructions how to perform e-tests with examples in the e-study environment	0.7	7.9	8.6	26.8	56.0
Q10 Availability of interactive e-study environment at any time and place	1.0	4.8	4.5	23.2	66.5

January, 2019 at Rīga Stradinš University, when 418 local and foreign students of the first and second study year of the study programmes of Dentistry, Medicine, Nursing, Occupational Therapy, Physiotherapy and Public Health (Table 1) were interviewed using the questionnaire, comprising a list of 10 statements with 5 multiple categorical answers (a respondent had to choose only one of them) (Table 2) and an open-ended comment. The slightly modified statements were borrowed from the study in [9], but the survey procedure was simplified by abandoning the Kano two-dimensional model, which caused difficulties for respondents to be "consistent" in giving answers resulting in a low response rate [9]. To find out homogeneity of student groups, a cluster analysis and statistical tests were performed. Factor analysis was performed to find a simpler model based on a few concepts. The descriptive and inferential assessment of students' responses, two-step cluster and factor analysis procedures, and tests were processed using IBM SPSS Statistics 20 (a significance level of 95%).

The two-step cluster analysis was conducted to find out whether there are different groups of students with similar satisfaction and perception. Three clusters (Table 3) were segregated using the attributes as evaluation fields. The segregation yielded in the silhouette coefficient (within the range of 0.5 - 1.0) measuring both a good cohesion and separation with the outlier treatment of 8%.

To better highlight the differences between clusters, Table 3 shows only the percentage above 50, which describes the distribution of responses among clusters. Most of the responses "*I am dissatisfied*" and "*I do not care*" were given by the foreign students (cluster 1) who studied the course "Medical Terminology in Latin". The exception was the attribute Q6, for which the highest response "*I am satisfied*" rate was given within this cluster and 30% among the clusters. The local students were segregated between two clusters according to the study courses. In cluster 3, the response "*I am dissatisfied*" dominated for the attributes Q5, Q6, Q7 and Q10. In cluster 2, the responses varied (for each attribute less than 50%), except for the attribute Q2, for which the response "*I am dissatisfied*" was the most frequent (45%) among clusters.

Table 3. Distribution of students' responses among clusters

	Cluster 1 29.7%	Cluster 2 33.5%	Cluster 3 36.8%
Students	Foreign 100%	Local 50%	Local 50%

Q/	1 uo noi cure (5076)		I can accept (50%)
08	I am dissatisfied (70%)		L_{can} accept (50%)
20	I do not care (50%)		1 cun accept (50%)
Q9	I do not care 50%)		
Q10	I do not care (65%)		I am dissatisfied (70%)

In order to assess whether there were differences between student groups, study programs and courses on the one hand and the frequency of the respective response on the other hand, the index for each attribute was introduced, which was expressed as a percentage of one-type given response on all attributes by each respondent. Table 4. summarizes the Mann-Whitney U test results of p-values, which indicates a statistically significant (p<0.05) difference in almost all responses, except "I can accept", between local and foreign students. Statistically significant differences also exist between student groups, genders and study courses with respect to the response " I do not care". In Table 5, p-values indicate statistically significant differences between the students of the following study programmes: Dentistry - Medicine, Dentistry -Public Health, Public Health - Nursing and Public Health -Occupational Therapy with respect to the response " I am satisfied ". In Table 6, p-values indicate statistically significant differences between the students of the following study programmes: Dentistry – Public Health, Medicine – Physiotherapy, Medicine – Public Health, Occupational Therapy – Physiotherapy and Physiotherapy – Public Health with respect to the response " I can accept ". No statistically significant differences were confirmed among the students with respect to the rest of responses.

Table 4. Mann-Whitney U test results on differences in responses between students groups, gender and study courses (**p-values**, asymp. sig., 2-tailed)

	I am dissatisfied	I do not care	I can accept	I consider important	I am satisfied

A principal components and principal axis factoring analysis with both the varimax and direct oblique (delta 0) rotation were conducted to assess underlying variables. All the analyses provided 4 extracted factors containing the same items (Table 7). The maximum likelihood (varimax) analysis confirmed goodness-of-fit of the model: 4 factors ($\chi 2 = 12.083$, df = 11, p = 0.357), which explained 66.155% of the total variance (principal components analysis, varimax).

 Table 7. Rotated component matrix (principal components, varimax)

	Factor Loading

Q5		0.747				
Q1			0.819			
Q2			0.631			
Q10				0.906		

5. DISCUSSION

The student satisfaction rate was around 50% and above (Table 2) for almost all the attributes; the students were more satisfied with the delivery aspects of those courses than the content aspects, which was stated by Roach and Lemasters [8]. Each attribute contributed differently to satisfaction, which is in line

with several other studies [1, 3, 4, 6, 8, 11, 12, 13, 14]. For instance, Strong, Irby, Wynn and McClure [11] and Cole, Shelley and Swartz [13] found that the most cited reasons for satisfaction – convenience; for dissatisfaction – lack of interaction. The findings of the authors in [4] showed that students (more than 21,000 respondents in the study) were highly satisfied by the e-learning education; highest score – instructor support, lowest score – tutorial support. Sary and Herlambang [3] noticed a positive correlation between student satisfaction and the effectiveness (target achievement, adaptability, satisfaction and responsibility) of the implementation of the e-learning, which corresponds to the results of the present study (mostly related to the response "*I consider important*").

The attribute of availability of audio/video resources in the estudy environment is contradictory for it received the highest response rates of "I do not care" and "I am dissatisfied". This coincides with the results of the study [8] and can be attributed as content weakness. However, the response "I do not care" may imply that these resources are abundantly available in other sources. The same can be addressed to communication options.

Considering that the differences between the response frequencies for "*I am satisfied*"-"*I consider important*" and "*I consider important*"-"*I can accept*" are practically the same and fall within the range of 18% - 22% for such attributes as Q1, Q8 and Q7, it can be concluded that these attributes are evaluated by students as the key factors of b-learning. For the same reason of similar response frequencies for "*I do not care*"-" *I am dissatisfied*" (0.7% - 7.2%), one can assume that both the attributes Q2 and Q9 are treated negatively by those students who do not succed in b-learning.

The authors of the present study did not find any research performed on satisfaction of e-learning, using the cluster analysis, however, Bauk, Šćepanović and Kopp [9] hinted that different analytical methods in assessing the level of satisfaction should be recommended. This method can be easily used to identify groups of individuals that are similar to each other but different from others in other groups. The cluster analysis carried out in this study identified three clusters that were almost equally distributed. Surprisingly, all the foreign students in Cluster 1 were the most critical and indifferent to almost all the attributes. This fact can be consistent with Sunkara and Kurra's [7], which revealed the need for personalized and more adaptive and customized e-learning systems with possible support to satisfy the needs of learners including learning styles. Cluster 2 included local students who chose all the responses almost equally to all the attributes, but for the attribute Q6 the response "I do not care" dominated in this cluster. Possibly, each of those students could have different experience in b-learning, therefore not paying so much attention to self-assessment resources provided in e-study environment. The students of Cluster 3 seem to be more dissatisfied with the crucial aspects of e-learning, but they could accept the attributes Q1, Q7 and Q8, which may give the impression that they were forced to accept b-learning.

The satisfaction difference among the students of different study programmes is in line with the results of cluster analysis. These statistically significant differences existed between local and foreign students, genders and study courses with respect to the response "*I do not care*", possibly suggesting that other

factors influence student satisfaction of e-learning. Chandrasiri and Jayasinghe [12] discovered in the research that subjective norms or social influence had a direct impact on satisfaction. In addition, Pham L., Limbu, Bui, Nguyen and Pham H. T. [15] found the relationship between student satisfaction and student loyalty. Besides, phychological predispositions studied by Dziuban et al. [16] played an important role suggesting that other latent factors may exist.

Students expressed their b-learning perception of the attributes proposed in the survey, mainly based on their subjective judgments, which could be expressed as both an assessment of the learning experience they acquired and their willingness to expect something useful in this type of learning process. Therefore, such a student satisfaction should be seen in two ways: positive assessments and critical reviews.

Factor analysis was performed to find a simpler model based on fewer factors. The loading of Q8 was less than 0.4 and it was common to several other factors, therefore it was excluded, which is understandable for all the items included in the survey related to b-learning. The interpretation of the 4 factors is given in Table 8. It should be noted that further research is needed to find other items (not only one) for additional special advantages as attractive attributes of satisfaction perception of b-learning.

Generally, for successful implementation of b-learning in various courses of Medical Terminology, the 4 factors should be considered as the underlying principles.

 Table 8. Interpretation of factors

Items	Factors
Q9 Availability of instructions how to perform e-tests with examples in the e-study environment Q3 Lecturer's instructions how to use the e- study environment Q7 Use of mandatory (graded) exercises	Instructional provision
and tests in the e-study environment Q6 Possibilities of knowledge self- assessment in the e-study environment	
Q5 A variety of communication options (<i>on-site: in pairs, groups - and on-line: Internet</i>) Q4 Availability of audio / video resources in the e-study environment	Provision of diverse communications
Q1 Technical stability and reliability in the e-study environment Q2 Easy to use and user-friendly interface of the e-study environment	Technical support and convenience
Q10 Availability of interactive e-study environment at any time and place	Special advantages

6. CONCLUSIONS

- Students considered the following attributes as the most satifying: availability of the e-learning environment at any time and place, its technical stability and reliability and instructions of its usage, but as the least satisfying – a variety of communication options and availability of audio/video resources since they are available in internet applications and forums.
- Most of the students of the study course "Medical Terminology in Latin" (Cluster 1) considered the attributes in the following decreasing order: Q3- Q9-Q6-Q5-Q7-Q1-

Q2-Q4-Q8-Q10, which indicates their greater demand (must-be) for these attributes of this order.

- 3) Most of the students of Cluster 2 and Cluster 3 considered the attributes in the same order, which indicates their greater satisfaction (attraction) with these attributes.
- 4) The study had some limitations: the Kano two-dimensional model was not used due to a complex understanding to provide answers and the number of satisfaction attributes was reduced to 10 for the same reason. Hence, some attractive satisfaction attributes were lost.
- 5) Statistically significant differences between local and foreign students, genders and study courses with respect to several responses on satisfaction of b-learning were proved.
- Statistically significant differences between students of several study programmes with respect to several responses on satisfaction of e-learning were proved.
- Four factors were found related to satisfaction perception of b-learning: instructional provision, provision of diverse communications, technical support and convenience, and special advantages.
- 8) It is necessary to explore continuously the stability of student satisfaction attributes of b-learning for they have an increasing impact on competitiveness in higher education.
